

7.26) b) Impulse invariance = aliasing

Bilinear Transformation = warping frequency axis

Bilinear Transform

d) Bilinear Transform

e) Impulse Invariance:

$$H_1(z) = \sum_{k=-\infty}^{\infty} H_{c1}(s - j \frac{2\pi}{T_d} k)$$

$$H_2(z) = \sum_{k=-\infty}^{\infty} H_{c2}(s - j \frac{2\pi}{T_d} k)$$

$$H_1(z) H_2(z) = \sum_{k=-\infty}^{\infty} \sum_{l=-\infty}^{\infty} H_{c1}(s - j \frac{2\pi}{T_d} k) H_{c2}(s - j \frac{2\pi}{T_d} l) \neq H(z)$$

Bilinear Transformation:

$$H_1(z) = H_{c1} \left[\frac{z}{T_d} \frac{1-z^{-1}}{1+z^{-1}} \right]$$

$$H_2(z) = H_{c2} \left[\frac{z}{T_d} \frac{1-z^{-1}}{1+z^{-1}} \right]$$

$$H_1(z) H_2(z) = H_{c1} \left[\frac{z}{T_d} \frac{1-z^{-1}}{1+z^{-1}} \right] H_{c2} \left[\frac{z}{T_d} \frac{1-z^{-1}}{1+z^{-1}} \right] = H_c \left[\frac{z}{T_d} \frac{1-z^{-1}}{1+z^{-1}} \right] = H(z)$$

Bilinear Transformation

$$7.27) a) H(e^{j\omega}) = \begin{cases} 1, & |\omega| < \frac{\pi}{4} \\ 0, & \frac{\pi}{4} < |\omega| \leq \pi \end{cases}$$

$$H(e^{j\omega}) \xrightarrow{\mathcal{F}^{-1}} h[n]$$

$$h[2n] \xrightarrow{\mathcal{F}} H_1(e^{j\omega})$$

$$H_1(e^{j\omega}) = \sum_{n=-\infty}^{\infty} h[2n] e^{-j\omega n}$$

$$= \sum_{\substack{n=2k, \\ k=-\infty}}^{\pi/4} h[n] e^{-\frac{j\omega n}{2}}$$

$$= \sum_{n=-\infty}^{\infty} \frac{1}{2} (h[n] + (-1)^n h[n]) e^{-\frac{j\omega n}{2}}$$

$$= \frac{1}{2} H(e^{j\frac{\omega}{2}}) + \frac{1}{2} H(e^{j\frac{\omega+2\pi}{2}})$$

$$b) h_2[n] = \begin{cases} h[n/2], & n = 0, \pm 2, \pm 4, \dots \\ 0, & \text{otherwise} \end{cases}$$

$$H_2(e^{j\omega}) = \sum_{n=-\infty}^{\infty} h_2[n] e^{-j\omega n}$$

$$= \sum_{\substack{n=2k \\ k=-\infty}}^{\infty} h[n/2] e^{-j\omega n}$$

$$= \sum_{n=-\infty}^{\infty} h[n] e^{-j\omega 2n}$$

$$= H(e^{j\omega 2})$$

$$c) \quad h_3[n] = (-1)^n h[n]$$

$$H_3(e^{j\omega}) = \sum_{n=-\infty}^{\infty} (-1)^n h[n] e^{-j\omega n}$$

$$= \sum_{n \text{ even}} h[n] e^{-j\omega n} - \sum_{n \text{ odd}} h[n] e^{-j\omega n}$$

$$= H(e^{j(\omega+\pi)})$$

3)

Specs:

$$0.98 < H(e^{j\omega}) < 1.02, \quad 0 \leq |\omega| \leq 0.63\pi$$

$$-0.15 < H(e^{j\omega}) < 0.15, \quad 0.65\pi \leq |\omega| \leq \pi$$

Analog Filter Specs:

$$0.98 < H(j\Omega) < 1.02, \quad 0 \leq \Omega \leq 2 \tan\left(\frac{0.63\pi}{2}\right)$$

$$-0.15 < H(j\Omega) < 0.15, \quad 2 \tan\left(\frac{0.65\pi}{2}\right) \leq \Omega \leq \infty$$

Design Constraints:

$$T_d = 1$$

$$|H_c(j2 \tan(0.315\pi))| > 0.98$$

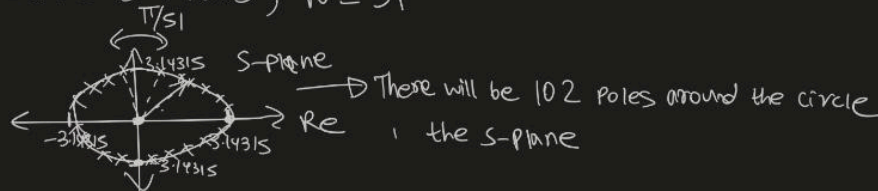

$$|H_c(j2 \tan(0.325\pi))| < 0.15$$

For Butterworth filter, $|H(j\Omega)|^2 = \frac{1}{1 + \left(\frac{\Omega}{\Omega_c}\right)^{2N}}$ and due to its monotonic response;

$$1 + \left(\frac{2 \tan(0.315\pi)}{\Omega_c}\right)^{2N} = \left(\frac{1}{0.98}\right)^2$$

$$1 + \left(\frac{2 \tan(0.325\pi)}{\Omega_c}\right)^{2N} = \left(\frac{1}{0.15}\right)^2$$

$$\Omega_c \approx 3.14315, \quad N = 51$$

$$H_c(s) = \frac{(\Omega_c)^N}{\prod_{k=1}^N (s - s_k)} \quad \rightarrow \text{Rest of steps are done using MATLAB code below}$$

$$4) \quad \omega_{pd} = \frac{2}{T_d} \tan\left(\frac{\omega_p}{2}\right)$$

$$\omega_{sd} = \frac{2}{T_d} \tan\left(\frac{\omega_s}{2}\right)$$

$H_1(s)$ will have $T_d = T_1$ designed to pre-warp ω_p & ω_s

$H_2(s)$ will have $T_d = T_2$ with same pre-warped frequencies

$$H_2(s) = H_1\left(s \frac{T_1}{T_2}\right)$$

$$\text{Starting from } H_1(s) \rightarrow H_1(z) = H_1\left(\frac{2}{T_1} \frac{1-z^{-1}}{1+z^{-1}}\right)$$

$$\begin{aligned} H_2(z) &= H_2\left(\frac{2}{T_2} \frac{1-z^{-1}}{1+z^{-1}}\right) = H_1\left(\frac{2}{T_2} \frac{1-z^{-1}}{1+z^{-1}} \frac{T_1}{T_2}\right) \\ &= H_1\left(\frac{2T_1}{T_2^2} \frac{1-z^{-1}}{1+z^{-1}}\right) \end{aligned}$$

In the appropriate bilinear transformation:

$$\frac{2}{T_1} \frac{1-z^{-1}}{1+z^{-1}} = \frac{2T_1}{T_2^2} \frac{1+z^{-1}}{1-z^{-1}}$$

$$\frac{z}{T_1} = \frac{2T_1}{T_2^2} \rightarrow \frac{1}{T_1} = \frac{T_1}{T_2^2} \rightarrow T_1^2 = T_2^2$$

Since $T_1, T_2 \geq 0$:

$$T_1 = T_2$$

Given a bilinear transformation where $T_d = T_1 = T_2$, both $H_1(s)$ and $H_2(s)$ will result in the same digital filter $H(z)$.
